

# FCC Test Report

# Part 15 subpart C

#### **Client Information:**

**Applicant** : Chengdu XGimi Technology Co.,Ltd.

Applicant add.: 5F,Building A7,Tianfu Software Park, Tianfu Avenue, Hi-tech

Zone, Chengdu, China.

#### **EUT Information:**

EUT Name : **LED Projector** 

Model No. SLP

Brand Name: XGIMI

FCC ID 2AFENSLP

### **Prepared By:**

DongGuan NTEK Testing Technology Co., Ltd.

Add.: 5/F, Building 11, Creative Industry Center Park, No. 34 Guantai Road,

Guancheng District, Dong Guan, 523000, P.R.China

Date of Test: July. 02~ 12, 2015 Date of Receipt: July. 02, 2015

Date of Issue: July. 12, 2015 Test Result: **Pass** 

Test procedure used: ANSI C63.4-2009

This device described above has been tested by DongGuan NTEK Testing Technology Co., Ltd., and the test results show that the equipment under test (EUT) is in compliance with the FCC requirements. And it is applicable only to the tested sample identified in the report.

\*This test report must not be used by the client to claim product endorsement by any agency of the U.S. government.

| Carrier Frequencies<br>Separated | FCC Part 15 C:2013 | Section 15.247(a)(1)       | PASS   |
| Hopping Channel Number           | FCC Part 15 C:2013 | Section 15.247(a)(1) (iii) | PASS   |
| Dwell Time                       | FCC Part 15 C:2013 | Section 15.247(a)(1) (iii) | PASS   |
| Maximum Peak Output Power        | FCC Part 15 C:2013 | Section 15.247(b)          | PASS   |
| Band edge                        | FCC Part 15 C:2013 | Section 15.247(d)          | PASS   |
| Conducted Spurious<br>Emissions  | FCC Part 15 C:2013 | Section 15.247(d)          | PASS   |

# 2.2 Measurement Uncertainty

All measurements involve certain levels of uncertainties, The following measurements uncertainty Levels have estimated based on ANSI C63.4:2009, the maximum value of the uncertainty as below

| No. | Item                    | Uncertainty |
|-----|-------------------------|-------------|
| 1   | Conducted Emission Test | ±1.38dB     |
| 2   | Radiated Emission Test  | ±3.57dB     |

Report No.: NTEK-2015DG0114046E

# 3 General Information

# 3.1 General Description of EUT

- 3. Pre-test the EUT in AC mode and B/O mode, find worse case in AC mode.
- 4. According to the declaration of the applicant, the electrical circuit design, layout, components used and internal wiring were identical for above models, with only difference being the model no.. Therefore, only one model SLP was tested in this report.

## 3.2 Description of Test conditions

(1) EUT was tested in normal configuration (Please See following Block diagram)

#### (2) E.U.T. test conditions:

15.31(e): For intentional radiators, measurements of the variation of the input power or the adiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. For battery operated equipment, the equipment tests shall be performed using a new battery.

#### (3) Test frequencies:

According to the 15.31(m) Measurements on intentional radiators or receivers, other than TV broadcast receivers, shall be performed and. If required reported for each band in which the device can be operated with the device operating at the number of frequencies in each band specified in the following table:

| Frequency range over  | Number of   | Location in                   |
|-----------------------|-------------|-------------------------------|
| which device operates | frequencies | the range of operation        |

### 5 Test Result

# 5.1 Antenna Requirement

#### 5.1.1 Standard requirement

15.203 requirement: For intentional device, according to 15.203: an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

Report No.: NTEK-2015DG0114046E

15.247(c) (1)(i) requirement: (i) Systems operating in the 2400-2483.5 MHz band that is used exclusively for fixed. Point-to-point operations may employ transmitting antennas with directional gain greater than 6dBi provided the maximum conducted output power of the intentional radiator is reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6dBi.

#### 5.1.2 EUT Antenna

The antenna is integrated on the main PCB and no consideration of replacement. Antenna gain is max 0 dBi from 2.4GHz to 2.5GHz.

Report No.: NTEK-2015DG0114046E

#### **5.2 Conduction Emissions Measurement**

#### 5.2.1 Applied procedures / Limit

| Frequency of Emission (MHz) | Conducte   | d Limit (dBμV) |
|-----------------------------|------------|----------------|
|                             | Quasi-peak | Average        |
| 0.15-0.5                    | 66 to 56 * | 56 to 46 *     |
| 0.5-5                       | 56         | 46             |
| 5-30                        | 60         | 50             |

Note: Decreases with the logarithm of the frequency.

#### 5.2.2 Test procedure

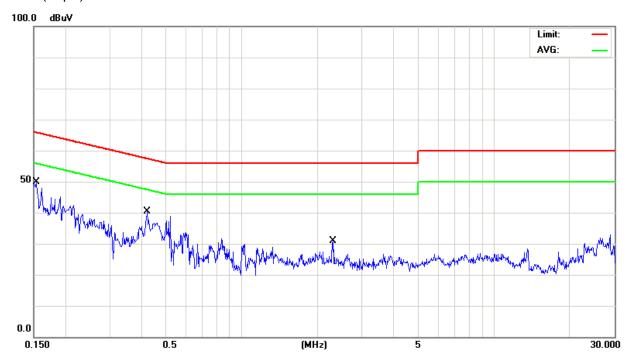

EUT was placed upon a wooden test table 0.8m above the horizontal metal reference plane and 0.4m from the vertical ground plane, and it was connected to an AMN. The closest distance between the boundary of the EUT and the surface of the AMN is 0.8m. All peripherals were connected to another AMN, and placed at a distance of 10cm from each other. A spectrum and receiver was connected to the RF output port of the AMN. Both average and quasi-peak value were detected.

#### 5.3 Radiated Emissions Measurement

#### 5.3.1 Applied procedures / Limit

15.247(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

|                             | Field Stre   | ngth | Measurement          |

#### 5.3.2 Test procedure

EUT was placed upon a wooden test table which was placed on the turn table 0.8m above the horizontal metal ground plane, and operating in the mode as mentioned above. A receiving antenna was placed 3m away from the EUT. During testing, turn around the turn table and move the antenna from 1m to 4m to find the maximum field-strength reading. All peripherals were placed at a distance of 10cm between each other. Both horizontal and vertical antenna polarities were tested and performed pretest to three orthogonal axis. The worst case emissions were reported.

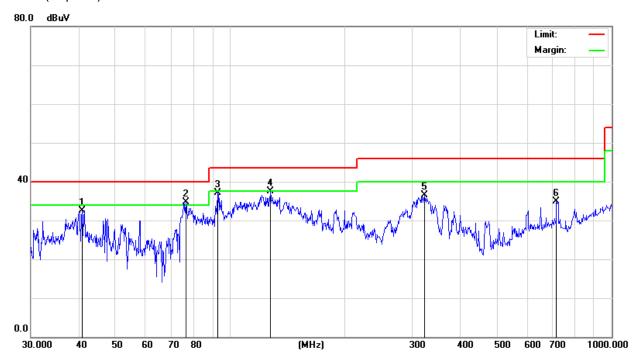

#### 5.3.3 Test Result

There is not detected blow 30MHz.

Remark: No any other emission which falls in restricted bands can be detected and be reported.

Test result: The unit does meet the FCC requirements.

**5.4 BANDWIDTH TEST** 

#### 5.4.1 Applied procedures / Limit

For frequency hopping system operating in the 2400-2483.5MHz, If the 20dB bandwidth of hopping channel is greater than 25kHz, two-thirds 20dBbandwidth of hopping channel shell be a minimum limit for the hopping channel separation.

Report No.: NTEK-2015DG0114046E

#### 5.4.2 Test procedure

- a. The EUT was directly connected to the spectrum analyzer and antenna output port as show in the block diagram below.
- b. Spectrum Setting: RBW= 100KHz, VBW≧RBW, Sweep time = Auto.

#### 5.4.3 Deviation from standard

No deviation.

#### 5.4.4 Test setup

5.5 Carrier Frequencies Separated

#### 5.5.1 Applied procedures / Limit

15.247(a) (1) Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

Report No.: NTEK-2015DG0114046E

#### 5.5.2 Test procedure

- (1) Connected the antenna port to the Spectrum Analyzer, set the Spectrum Analyzer as RBW=100kHz, VBW≧RBW, Sweep time=Auto, Detector Function=Peak.
- (2) The EUT should be transmitting at its maximum data rate. Use the marker-delta function to determine the separation between the peaks of the adjacent channels.
- (3) The above procedure shall be repeated at the lowest, the middle, and the highest frequency of the stated frequency range with modulated mode. also shall be performed at different modes of operation.

#### 5.5.3 Deviation from standard

No deviation.

#### 5.5.4 Test results

| EUT:         | LED Projector            | Model Name:        | SLP  |
|--------------|--------------------------|--------------------|--|
| Temperature: | <b>22</b> ℃              | Relative Humidity: | 53%  |
| Pressure:    | 1010 hPa                 | Test Power :       | DC 19V from adapter, AC 120V/60Hz foradapter |
| Test Mode:   | TX 3Mbps(the worst case) |                    |  |

Report No.: NTEK-2015DG0114046E

#### Test result:

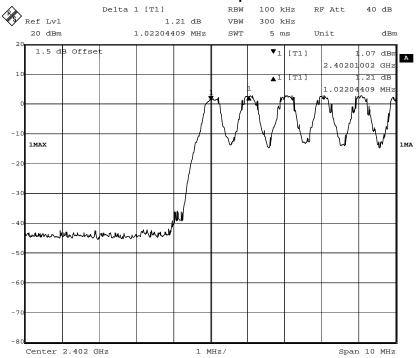

| Test Channel                                   | Carrier Frequencies Separated | Pass/Fail |
|--|-------------------------------|-----------|
| Lower Channels (channel 0 and channel 1)       | 1.022MHz                      | Pass      |
| Middle Channels<br>(channel 39 and channel 40) | 1.042MHz                      | Pass      |
| Upper Channels (channel 77 and channel 78)     | 1.022MHz                      | Pass      |

#### Remark:

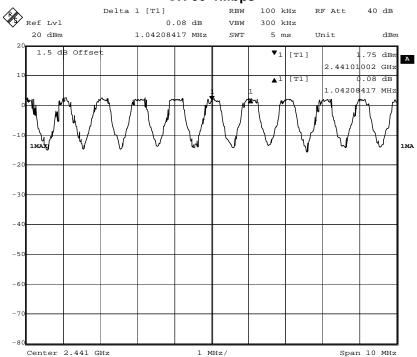

The limit is maximum two-thirds of the 20 dB bandwidth: 935 KHz.

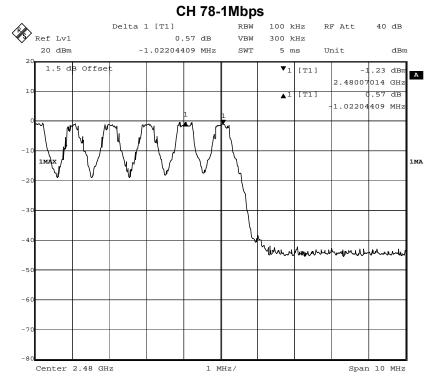

#### CH 00-1Mbps

#### CH 39-1Mbps

Test result: The unit does meet the FCC requirements.

5.6 Hopping Channel Number

### 5.6.1 Applied procedures / Limit

15.247(a) (1) (iii) Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

Report No.: NTEK-2015DG0114046E

#### 5.6.2 Test procedure

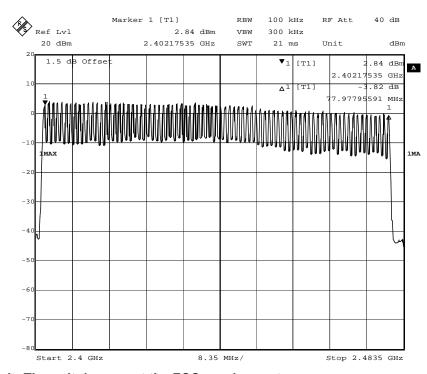

- (1) Connected the antenna port to the Spectrum Analyzer , set the Spectrum Analyzer as RBW=100kHz,VBW≧RBW, Sweep time=Auto, Detector Function=Peak Trace=Maxhold.
- (2) The EUT should be have its hopping function enabled. Maxhold and record hopping channels It may prove necessary to break the span up to sections, in order to clearly show all of the hopping frequencies.

#### 5.6.3 Test result

| Hopping Channel Number result |          |                      |            |  |  |

| Temperature: | <b>22</b> ℃   | Relative Humidity: | 53%  |
| Pressure:    | 1010 hPa      | Hest Power:        | DC 19V from adapter, AC 120V/60Hz foradapter |
| Test Mode:   | TX 1Mbps      |                    |  |

Test result: The unit does meet the FCC requirements.

5.7 Dwell time

## 5.7.1 Applied procedures / Limit

15.247(a) (1) (iii) Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

Report No.: NTEK-2015DG0114046E

## 5.7.2 Test procedure

- 1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
- 2. Set spectrum analyzer span = 0. centered on a hopping channel;
- 3. Set RBW = 1 MHz and VBW = 1 MHz. Sweep = as necessary to capture the entire dwell time per hopping channel. Detector Function = Peak. Trace = Max hold;
- 4. Use the marker-delta function to determine the dwell time. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.). Repeat this test for each variation. The limit is specified in one of the subparagraphs of this Section. Submit this plot(s). An oscilloscope may be used instead of a spectrum analyzer.

## 5.7.3 Test result

| 3DH5 time slot                 | =                       | 2.910 | (ms) | * | 11 | * | (31.6/3.16) | = | 320.100 | ms |

The average time of occupancy in the specified 31.6 second period is equal to pulse width\*(# of pulse in observation period)\*(test period / observation period)

The results are not greater than 0.4 seconds.

The unit does meet the FCC requirements.

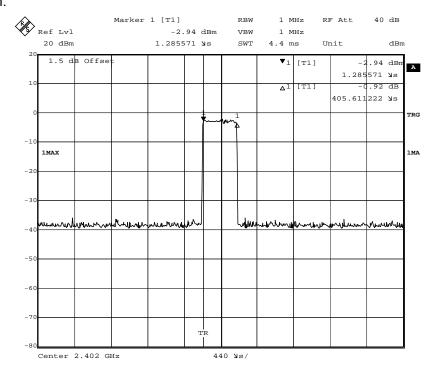

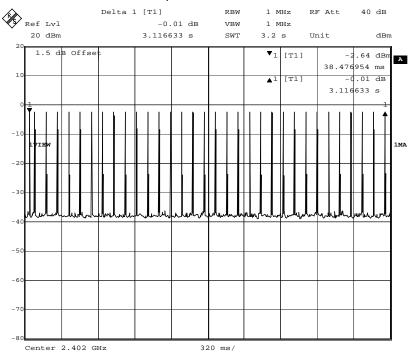

#### Result plot as follows:

## 1. Lowest channel (2.402 GHz):

(1). 3DH1

#### Pulse Width:

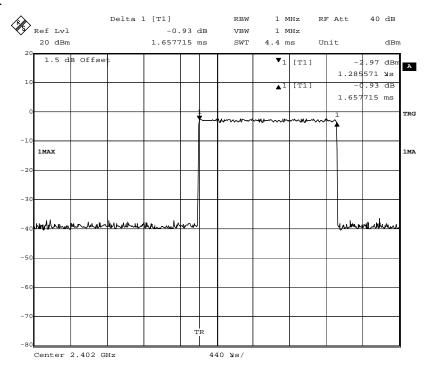

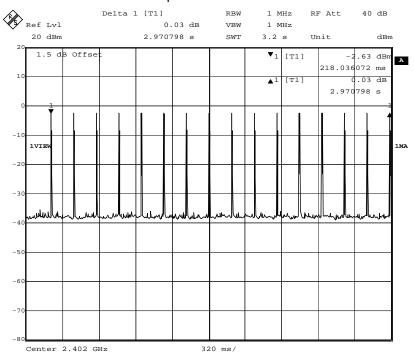

## (2) 3DH3

#### Pulse Width:

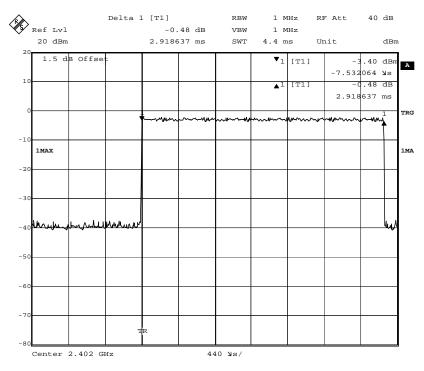

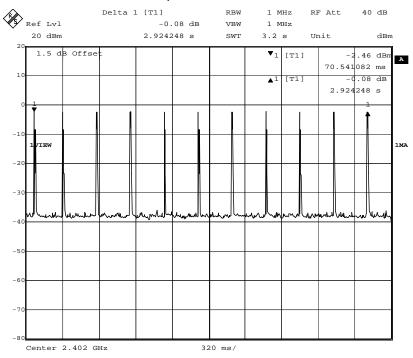

## (3) 3DH5

#### Pulse Width:

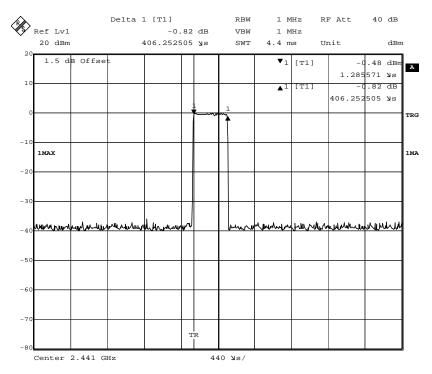

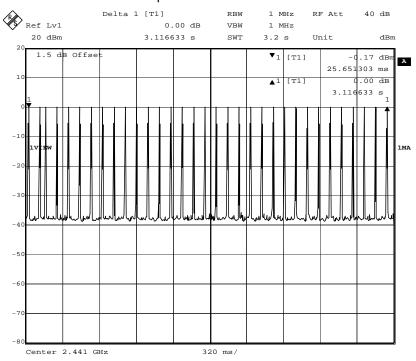

## 2. Middle Channel (2.441 GHz):

## (1). 3DH1

#### Pulse Width:

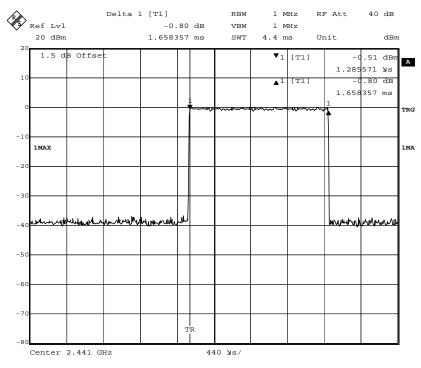

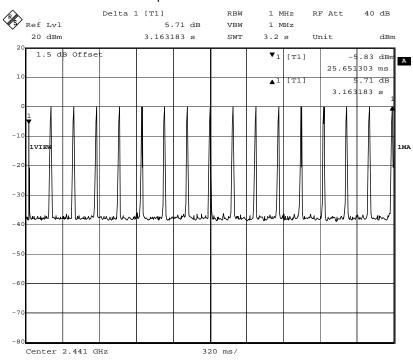

## (2) 3DH3

#### Pulse Width:

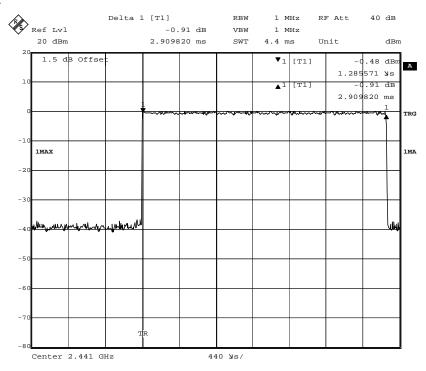

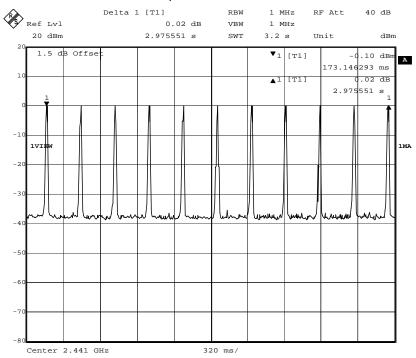

## (3) 3DH5

#### Pulse Width:

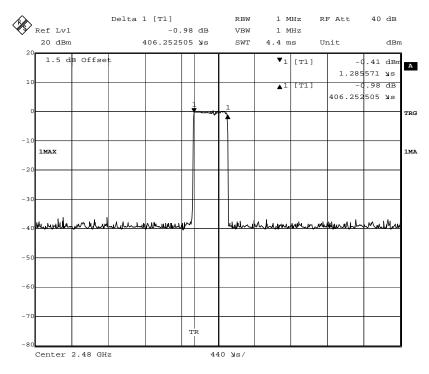

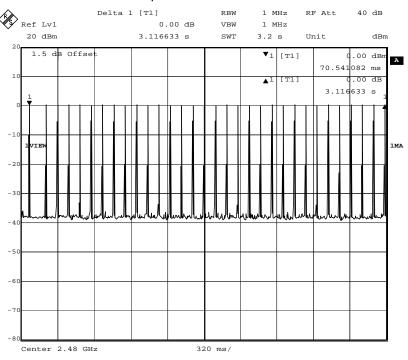

## 3. Highest Channel (2.480 GHz):

## (1). 3DH1

## Pulse Width:

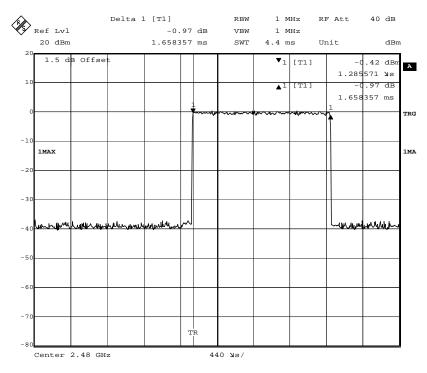

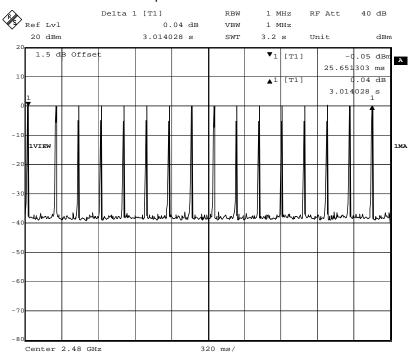

## (2) 3DH3

#### Pulse Width:

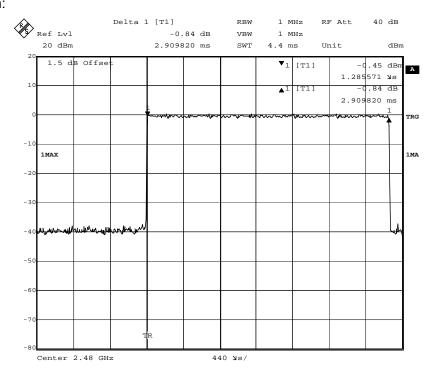

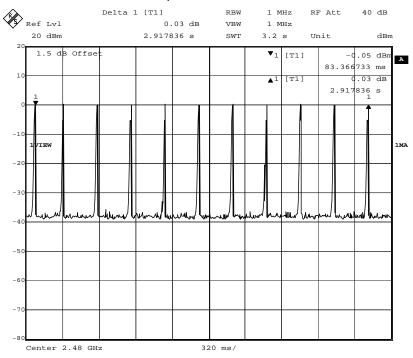

## (3) 3DH5

#### Pulse Width:

## 5.8 Maximum Peak Output Power

## 5.8.1 Applied procedures / Limit

15.247(b) (1) For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts.

## 5.8.2 Test procedure

- (1) Connected the antenna port to the Spectrum Analyzer, set the Spectrum Analyzer as RBW=3MHz,VBW≧RBW, Sweep time=Auto, Detector Function=Peak.
- (2) The EUT should be transmitting at its maximum data rate. Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. The indicated level is the peak output power.
- (3) The above procedure shall be repeated at the lowest, the middle, and the highest frequency of the stated frequency range with modulated mode. also shall be performed at different modes of operation.

#### 5.8.3 Deviation from standard

No deviation.

## 5.9.1 Applied procedures / Limit

15.247(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

Report No.: NTEK-2015DG0114046E

## 5.9.2 Test procedure

- a. The EUT was directly connected to the spectrum analyzer and antenna output port as show in the block diagram below.
- b Spectrum Setting: RBW=100kHz, VBW ≧ RBW, Sweep time=Auto, Detector Function=Peak.
